

Greenplum Healthcheck: Deployment Guide

It is recommended to run the Greenplum Healthcheck script in a **restrictive mode** and **during off-peak hours**. This approach is advised because certain operations, such as `gpcheckcat` and functions like `gp_size_of_table_disk`, can be time-consuming, especially in a production environment.

Prerequisites

Ensure you have the following information ready:

- The Greenplum Port Number.
- The full file path to the GP Hosts file.

Execution Instructions

Perform the following steps on your Greenplum coordination host:

1. **Extract the Script:** Unzip the GP health check script into the `/home/gpadmin/` directory.
2. **Log In:** Log in to your Greenplum environment using the `gpadmin` user.
3. **Set Permissions:** Assign execute permission to the script: `chmod +x gp_healthcheck_html.sh`
4. **Execute:** Run the script: `gp_healthcheck.sh`. Wait for the process to finish. This will generate a log file named `gp_healthcheck_report_<timestamp>.html`.
5. **Review and Share:** Inspect the generated report file for any confidential information before submitting it to the Tanzu account team.
6. Send the file to the Tanzu account team for review.
